

Actividades.

2. Crear el subdirectorio todo-daw02/delimitado teniendo en cuenta que:

- ✓ El directorio todo-daw02 permite el acceso a cualquier usuario.
- ✓ El subdirectorio todo-daw02/delimitado permite el acceso solamente al usuario admin.

Paso 1:

Crear los usuarios y password con htpasswd

```
rsc@ubuntuuserver:~$ sudo htpasswd -c /etc/apache2/.htpasswd daw1
New password:
Re-type new password:
Adding password for user daw1
rsc@ubuntuuserver:~$ sudo htpasswd /etc/apache2/.htpasswd daw2
New password:
Re-type new password:
Adding password for user daw2
rsc@ubuntuuserver:~$ cat /etc/apache2/.htpasswd
daw1:$apr1$ZMX.0euz$/R0F5NH3e0kFsSV9ho2EY/
daw2:$apr1$Fi/yE3cr$gQ6SkFJ4w9dg6W9mxHhox/
rsc@ubuntuuserver:~$
```

Paso 2:

Añadir un nuevo directory al archivo daw02-ssl.conf

```
# o StdEnvVars:
#   This exports the standard SSL/TLS related `SSL_*' environment variables.
#   Per default this exportation is switched off for performance reasons,
#   because the extraction step is an expensive operation and is usually
#   useless for serving static content. So one usually enables the
#   exportation for CGI and SSI requests only.
# o OptRenegotiate:
#   This enables optimized SSL connection renegotiation handling when SSL
#   directives are used in per-directory context.
#SSLOptions +FakeBasicAuth +ExportCertData +StrictRequire
<FilesMatch "\.(cgi|shtml|phtml|php)$">
    SSLOptions +StdEnvVars
</FilesMatch>
<Directory /usr/lib/cgi-bin>
    SSLOptions +StdEnvVars
</Directory>

<Directory "/var/www/html/todo-daw02/public_html/delimitado">
    AuthType Basic
    AuthName "Contenido Restringido, solo admin"
    AuthUserFile /etc/apache2/.htpasswd
    Require valid-user
</Directory>
# SSL Protocol Adjustments:
# The safe and default but still SSL/TLS standard compliant shutdown
# approach is that mod_ssl sends the close notify alert but doesn't wait for
# the close notify alert from client. When you need a different shutdown
# approach you can use one of the following variables:
# o ssl-unclean-shutdown:
#   This forces an unclean shutdown when the connection is closed, i.e. no
#   SSL close notify alert is send or allowed to received. This violates
#   the SSL/TLS standard but is needed for some brain-dead browsers. Use
#   this when you receive I/O errors because of the standard approach where
#   mod_ssl sends the close notify alert.
# o ssl-accurate-shutdown:
#   This forces an accurate shutdown when the connection is closed, i.e. a
"/etc/apache2/sites-available/daw02-ssl.conf" 139L, 6566B                               102,51-65      81%
```

Paso 3:

Comprobar con apachectl configtest si esta bien la sintaxis del archivo anterior

```
rsc@ubuntuuserver:~$ sudo apachectl configtest
AH00558: apache2: Could not reliably determine the server's fully qualified domain name, using 127.0
.1.1. Set the 'ServerName' directive globally to suppress this message
Syntax OK
rsc@ubuntuuserver:~$
```

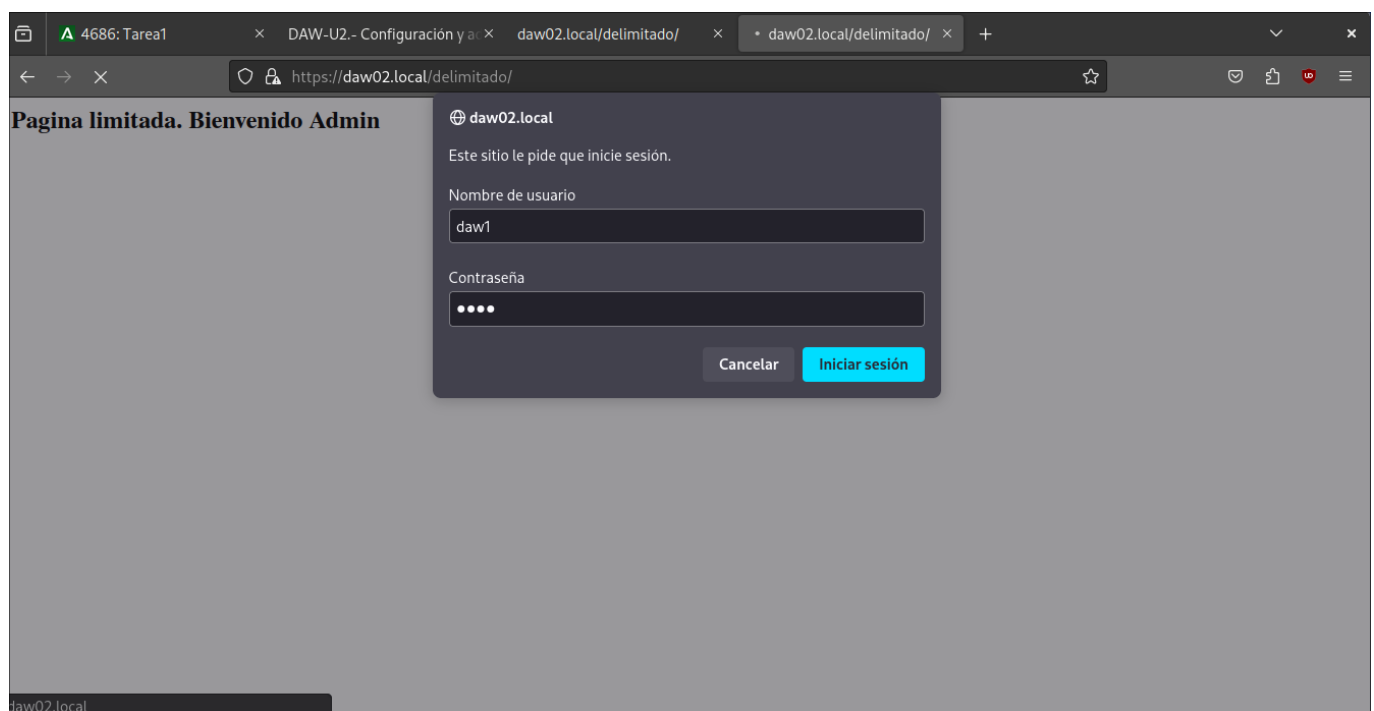

Paso 4:

Le damos permisos a la nueva carpeta.

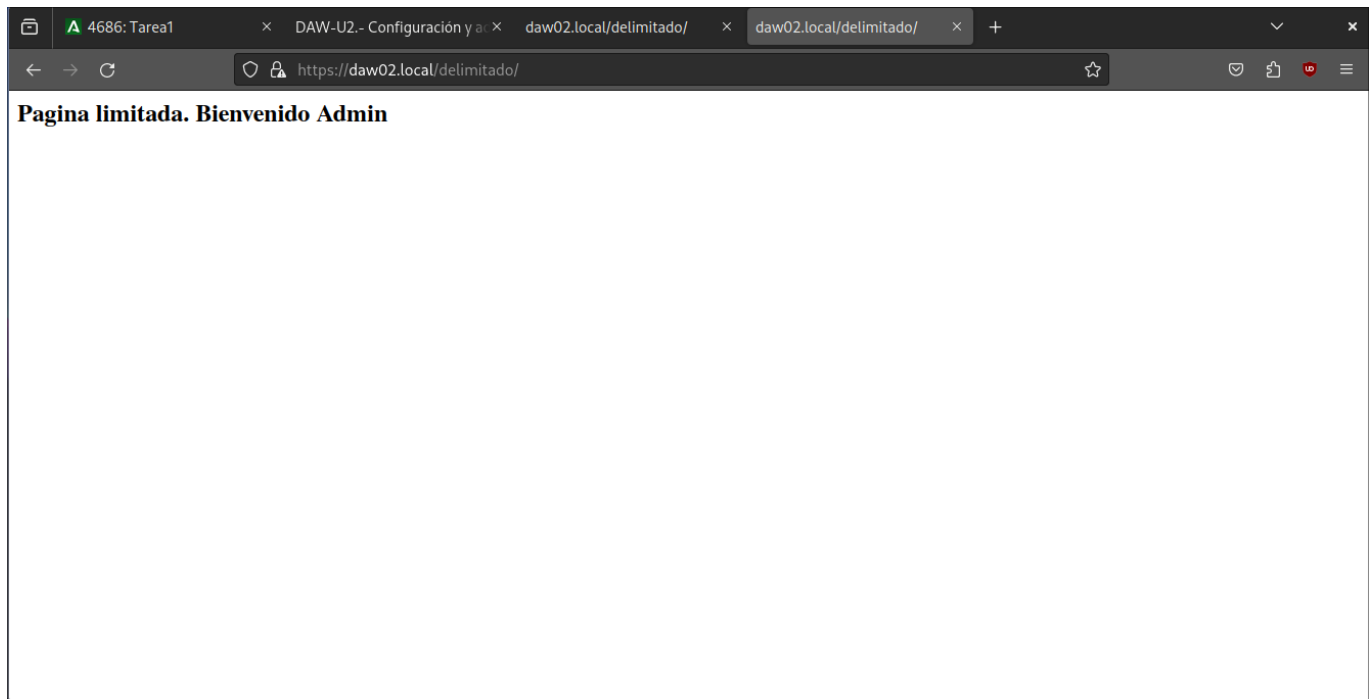

```
rsc@ubuntuserver:~$ ls -l /var/www/html/todo-daw02/
total 4
drwxr-xr-x 3 755 www-data 4096 oct 26 08:56 public_html
rsc@ubuntuserver:~$ ls -l /var/www/html/todo-daw02/public_html/
total 8
drwxr-xr-x 2 root root    4096 oct 26 08:56 delimitado
-rw-r--r-- 1 755 www-data 205 oct 19 07:06 index.html
rsc@ubuntuserver:~$
```

Paso 5:

Entramos a la nueva web de delimitado

Una vez hecho el login

Configurar los archivos de registro como sigue:

- ✓ Identificación log de acceso: daw02-access.log.
- ✓ Identificación log de error: daw02-error.log.
- ✓ Alias logformat: combined

Paso 1:

Añadimos los logs para daw02 en el archivo -ssl.conf del sitio y reiniciamos el apache.

```

<IfModule mod_ssl.c>
    <VirtualHost *:443>
        DocumentRoot /var/www/html/todo-daw02/public_html
        ServerName daw02.local
        ServerAlias www.daw02.local
        # Available loglevels: trace8, ..., trace1, debug, info, notice, warn,
        # error, crit, alert, emerg.
        # It is also possible to configure the loglevel for particular
        # modules, e.g.
        #LogLevel info ssl:warn

        ErrorLog ${APACHE_LOG_DIR}/daw02-error.log
        CustomLog ${APACHE_LOG_DIR}/daw02-access.log combined

        # For most configuration files from conf-available/, which are
        # enabled or disabled at a global level, it is possible to
        # include a line for only one particular virtual host. For example the
        # following line enables the CGI configuration for this host only
        # after it has been globally disabled with "a2disconf".
        #Include conf-available/serve-cgi-bin.conf

        # SSL Engine Switch:
        # Enable/Disable SSL for this virtual host.
        SSLEngine on

        # A self-signed (snakeoil) certificate can be created by installing
        # the ssl-cert package. See
        # /usr/share/doc/apache2/README.Debian.gz for more info.
        # If both key and certificate are stored in the same file, only the
        # SSLCertificateFile directive is needed.
        SSLCertificateFile /etc/apache2/cert-ssl/daw02.crt
        SSLCertificateKeyFile /etc/apache2/cert-ssl/daw02.key

        # Server Certificate Chain:
        # Point SSLCertificateChainFile at a file containing the
        # concatenation of PEM encoded CA certificates which form the
-- INSERTAR --

```

13,37-51 Comienzo

Paso 2:

Comprobamos que han sido creados.

```

CustomLog ${APACHE_LOG_DIR}/daw02-access.log combined

# For most configuration files from conf-available/, which are
# enabled or disabled at a global level, it is possible to
# include a line for only one particular virtual host. For example the
